

Focus Area 15: Injury and Violence Prevention

Objective 15-32 targets an overall reduction in the homicide death rate to 3.0 per 100,000 population.

California's age-adjusted death rates for homicide increased from 6.0 per 100,000 population in 2000 to 6.7 per 100,000 in 2004, but this was not a statistically significant trend (Figure 15-32, Table 15-32). California's homicide death rates are significantly higher than the HP2010 target of 3.0 per 100,000 population, and this objective has not yet been achieved.

Age-adjusted homicide death rates for males increased significantly from 9.6 per 100,000 in 2000 to 11.0 per 100,000 in 2004, and were significantly higher than homicide rates for females (2.2 per 100,000 in 2000 to 2.1 per 100,000 in 2004). This HP2010 objective is being achieved for females, but not for males as of 2004.

Data by race and ethnicity show that African Americans/Blacks experienced significantly higher age-adjusted homicide rates (30.0 per 100,000 in 2004) than any other racial or ethnic population with reliable rates. Homicide rates for African Americans/Blacks are ten times greater than the HP2010 objective, and over four times greater than the statewide rate. The next highest homicide death rates were found for Hispanics/Latinos (7.5 per 100,000 in 2004). The HP2010 objective is not being achieved for either of these racial and ethnic groups as of 2004. This objective is being achieved, however, for Asians (2.9 per 100,000 in 2004) and for Whites (2.9 per 100,000 in 2004). Also, the "Multirace" population had a rate of 2.9 per 100,000 in 2003, below the HP2010 target. Death rates for the American Indian/Alaska Native and the Pacific Islander populations were unreliable due to the small number of events, and are not reported here.
